Q: Accessing parent class variable from child class using `__call__`

in python here is the code sample:
class A: pass class B(A): pass class
C(A): pass class D(C): def
__call__(self): print A.name d = D()
print d() I was expecting to get an
error as the function is not allowed to
access the name variable inside the
parent class, but I get "AttributeError:
D instance has no attribute 'name'.
Clearly I'm missing something in here.

A: A.name refers to the A class
attribute named name (C.name refers
to the C class attribute named name
and so on). You can get the name of
the method's self object by calling
type(self).__name__: class A: pass
class B(A): pass class C(A): pass class
D(C): def __call__(self): print
type(self).__name__ d = D() print d() I
have been reading many articles
about solar, and what all it takes to

have successful people with it, and I am getting convinced every day that nothing could be more valuable than a clean energy source in this world. Not only does it reduce pollution, but more importantly, it creates jobs for people living in developing countries and for families in communities. I am really excited with the fact that the best money I have been spending lately is with solar energy, and I can be one of the reasons that thousands of people in developing countries have access to a clean, free, and renewable energy source.
